Data Types in MySQL Server

Numeric, String and Data Types

Numeric Data Types

- Numeric data types have certain range
- Their range can be changed if they are:
 - **Signed** - represent numbers both in the positive **and** negative ranges
 - **Unsigned** - represent numbers **only** in the positive range
- E.g. signed and unsigned INT:

Signed Range		Unsigned Range	
Min Value	Max Value	Min Value	Max Value
-2147483648	2147483648	0	4294967295

Numeric Data Types

- **INT** [(M)] [UNSIGNED]
 - TINYINT, SMALLINT, MEDIUMINT, BIGINT
- **DOUBLE** [(M, D)] [UNSIGNED]
 - E.g. DOUBLE[5, 2] – 999.99
- **DECIMAL** [(M, D)] [UNSIGNED] [ZEROFILL]

Digits stored for value

Decimals after
floating point

String Types

- String column definitions include attributes that specify the **character set** or **collation**

- **CHARACTER SET** (Encoding)

- E.g. utf8, ucs2

Determines the storage of each character (single or multiple bytes)

- **CHARACTER COLLATION** – rules for encoding comparison

- E.g. latin1_general_cs, Traditional_Spanish_ci_ai etc.

Determines the sorting order and case-sensitivity

- Set and collation can be defined at the database, table or column level

CHARACTER COLLATION - Example

- ORDER BY with different collations

latin1_swedish_ci	latin1_german1_ci	latin1_german2_ci
Muffler	Muffler	Müller
MX Systems	Müller	Muffler
Müller	MX Systems	MX Systems
MySQL	MySQL	MySQL

String Types (2)

- **CHAR** [(M)] - up to 30 characters
- **VARCHAR(M)** – up to 255 characters
- **TEXT** [(M)] – up to 65 535 characters
 - TINYTEXT, MEDIUMTEXT, LONGTEXT
- **BLOB - Binary Large Object** [(M)] - 65 535 ($2^{16} - 1$) characters
 - TINYBLOB, MEDIUMBLOB, LONGBLOB

Column name	Column Type
title	VARCHAR(CHAR)
content	TEXT(LONGTEXT)
picture	BLOB(LONGBLOB)

Date Types

- **DATE** - for values with a date part but **no time part**
- **TIME** - for values with time but **no date part**
- **DATETIME** - values that contain both date **and** time parts
- **TIMESTAMP** - both date **and** time parts

Column name	Column Type
birthdate	DATE
last_time_online	TIMESTAMP
start_at	TIME
deleted_on	DATETIME

DATETIME and
TIMESTAMP have
different time
ranges

Date Types (2)

- MySQL retrieves values for a given date type in a **standard output format**
 - E.g. as a string in either 'YYYY-MM-DD' or 'YY-MM-DD'

Data Type	Column Type
DATE	'0000-00-00'
TIME	'00:00:00'
DATETIME	'0000-00-00 00:00:00'
TIMESTAMP	'0000-00-00 00:00:00'
YEAR	0000

Database Modeling

Data Definition using GUI Clients

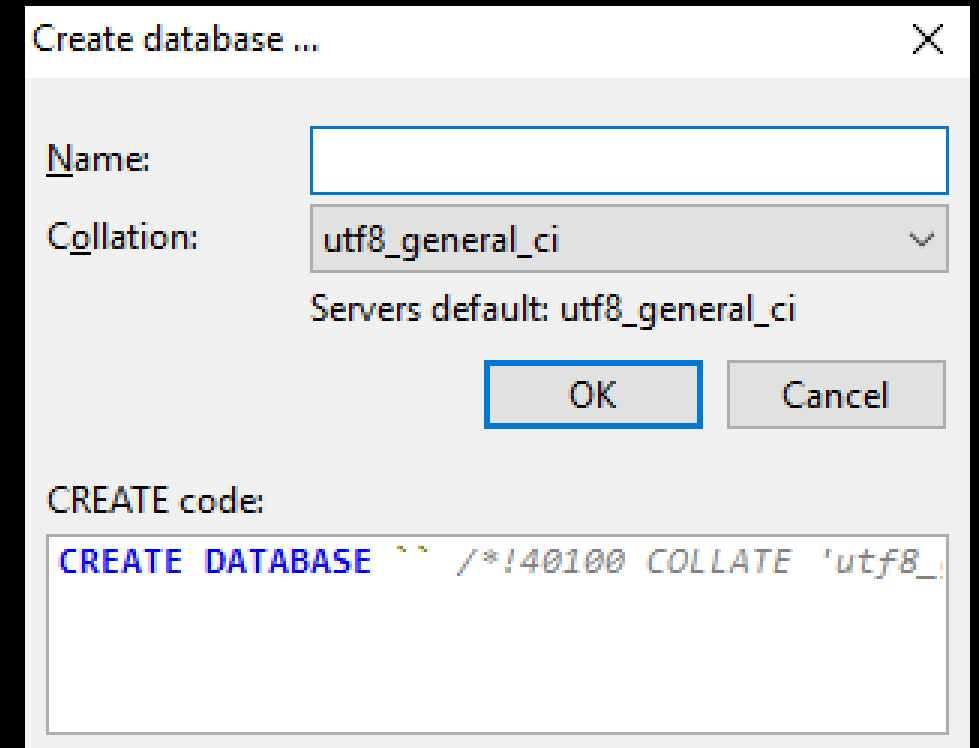

Working with IDEs

- We will **manage** databases with HeidiSQL
- Enables us:
 - To **create** a new database
 - To create **objects in the database** (tables, stored procedures, relationships and others)
 - To **change** the properties of objects
 - To **enter records** into the tables

Creating a New Database

- Select the instance **Create new -> Database** from the **context menu**

A screenshot of a 'Create database ...' dialog box. The dialog has a title bar with a close button. It contains the following fields and controls:

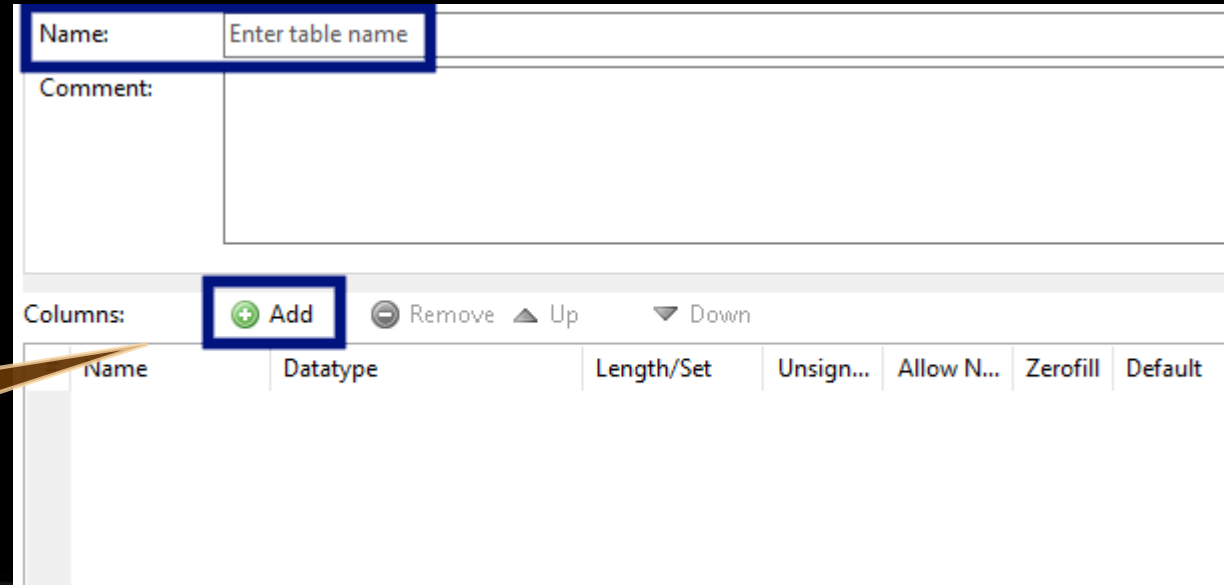

- Name:** A text input field.
- Collation:** A dropdown menu showing 'utf8_general_ci'. Below it, text reads 'Servers default: utf8_general_ci'.
- Buttons:** 'OK' and 'Cancel' buttons.
- CREATE code:** A text area containing the SQL code: `CREATE DATABASE ` ` /*!40100 COLLATE 'utf8_``

Creating Tables

- Right click on database **Select Create new -> Table**

Set up table name

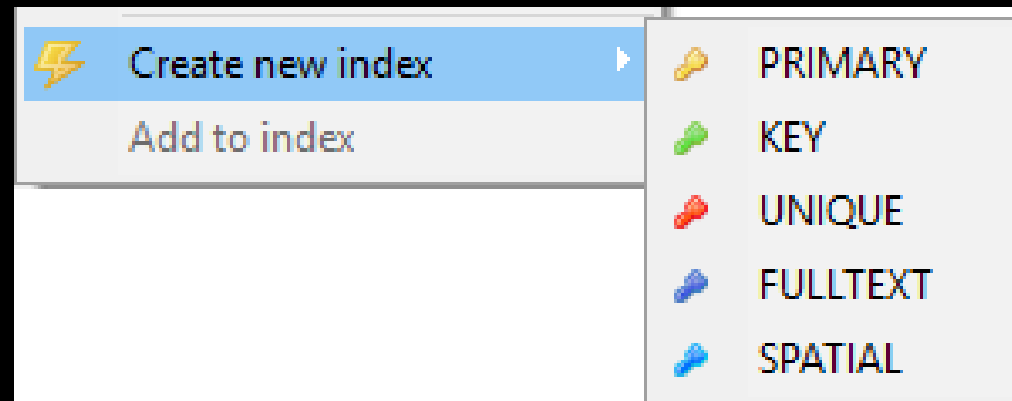

A dialog box for creating a new table. It has a 'Name:' field with the placeholder text 'Enter table name' and a 'Comment:' text area below it. At the bottom, there is a 'Columns:' section with an 'Add' button (highlighted with a blue box), a 'Remove' button, and 'Up' and 'Down' arrow buttons. Below these buttons is a table with columns: Name, Datatype, Length/Set, Unsign..., Allow N..., Zerofill, and Default.

Name	Datatype	Length/Set	Unsign...	Allow N...	Zerofill	Default
------	----------	------------	-----------	------------	----------	---------

Add new record

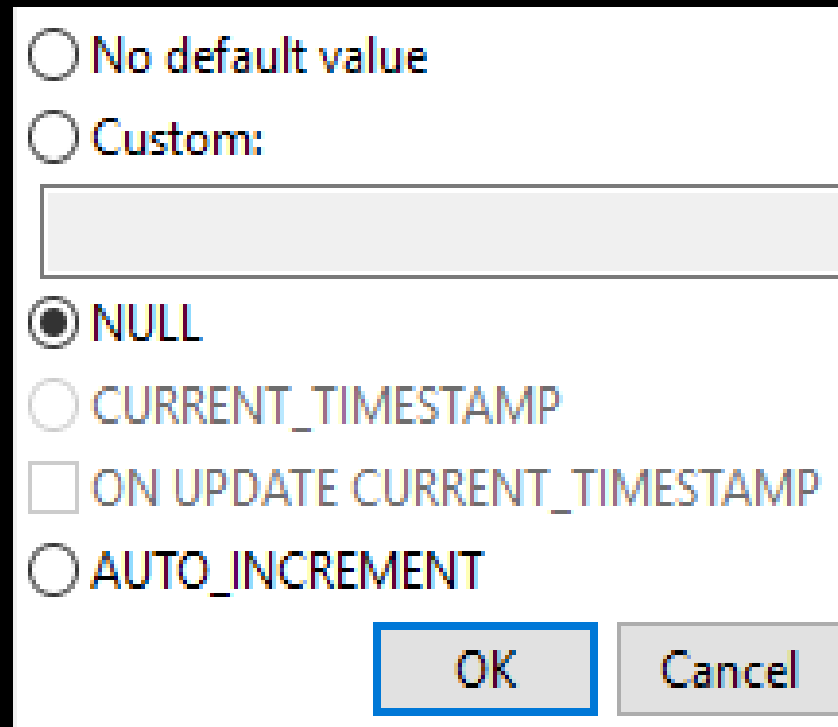

Creating Tables (2)

- A **Primary Key** is used to uniquely identify and index records
- Click on row **Create new index** -> **Primary** from the context menu of the desired row

Creating Tables (3)

- Auto increment – on the "Default" field

A screenshot of a database table creation dialog box. The dialog has a white background and a thin gray border. It contains several radio button options for setting a default value. The first option is "No default value". The second is "Custom:" followed by a text input field. The third option, "NULL", is selected with a filled radio button. Below it are "CURRENT_TIMESTAMP" and "ON UPDATE CURRENT_TIMESTAMP" (which is preceded by a checkbox). The last option is "AUTO_INCREMENT". At the bottom right are "OK" and "Cancel" buttons. The "OK" button is highlighted with a blue border.

☐ No default value

☐ Custom:

☒ NULL

☐ CURRENT_TIMESTAMP

☐ ON UPDATE CURRENT_TIMESTAMP

☐ AUTO_INCREMENT

OK Cancel

Storing and Retrieving Data

- We can **add**, **modify** and **read** records with GUI Clients
- To insert or edit a record, click inside the **cell**

#	Name	Datatype	Length/Set	Unsign...	Allow
 1	Example Row	INT	11	<input type="checkbox"/>	<input type="checkbox"/>

```
CREATE TABLE people
(
  id INT NOT NULL,
  email VARCHAR(50) NOT NULL,
  first_name VARCHAR(50),
  last_name VARCHAR(50)
);
```

Basic SQL Queries

Data Definition using SQL

SQL Queries

- We communicate with the database engine using SQL
- Queries provide greater **control** and **flexibility**
- To create a database using SQL:

Database name

```
CREATE DATABASE employees;
```

- SQL keywords are conventionally **capitalized**

Table Creation in SQL

Table name

```
CREATE TABLE people
```

```
(
```

```
  id INT NOT NULL,
```

```
  email VARCHAR(50) NOT NULL,
```

```
  first_name VARCHAR(50),
```

```
  last_name VARCHAR(50)
```

```
);
```

Custom properties

Column name

Data type

Retrieve Records in SQL

- Get all information from a table

Table name

```
SELECT * FROM employees;
```

- You can limit the columns and number of records

```
SELECT first_name, last_name FROM employees  
LIMIT 5;
```

List of columns

Number of records

Table Customization

Adding Rules, Constraints and Relationships

Custom Column Properties

- Primary Key

```
id INT NOT NULL PRIMARY KEY
```

- Auto-Increment (Identity)

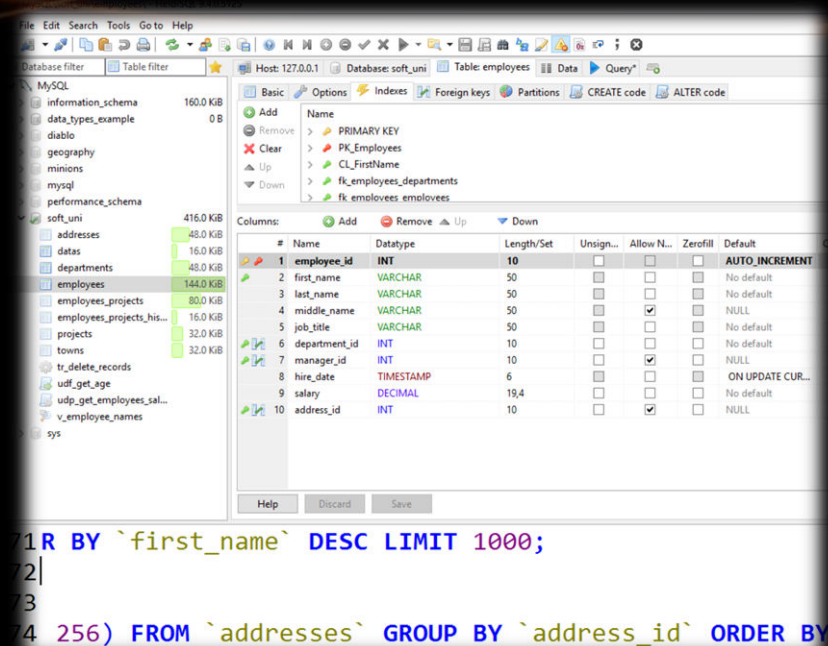

```
id INT AUTO_INCREMENT PRIMARY KEY
```

- Unique constraint – no repeating values in entire table

```
email VARCHAR(50) UNIQUE
```

- Default value – if not specified (otherwise set to **NULL**)

```
balance DECIMAL(10,2) DEFAULT 0
```

Altering Tables

Changing Table Properties After Creation

Altering Tables Using SQL

- A table can be changed using the keywords **ALTER TABLE**

```
ALTER TABLE employees;
```

Table name

- Add new column

```
ALTER TABLE employees  
ADD salary DECIMAL;
```

Column name

Data type

Altering Tables Using SQL (2)

- Delete existing column

```
ALTER TABLE people  
DROP COLUMN full_name;
```

Column name

- Modify data type of existing column

```
ALTER TABLE people  
MODIFY COLUMN email VARCHAR(100);
```

Column name

New data type

Altering Tables Using SQL (3)

- Add primary key to existing column

```
ALTER TABLE people  
ADD CONSTRAINT pk_id  
PRIMARY KEY (id);
```

Constraint name

Column name
(more than one for **composite key**)

- Add unique constraint

```
ALTER TABLE people  
ADD CONSTRAINT uq_email  
UNIQUE (email)
```

Constraint name

Columns name(s)

Altering Tables Using SQL (4)

- Set default value

```
ALTER TABLE people  
ALTER COLUMN balance SET DEFAULT 0;
```

Default value

Column name

Deleting Data and Structures

Dropping and Truncating

Deleting from Database

- Deleting structures is called **dropping**
 - You can drop **keys, constraints, tables** and entire **databases**
- Deleting all data in a table is called **truncating**
- Both of these actions **cannot be undone** – use with caution!

Dropping and Truncating

- To delete all the entries in a table

```
TRUNCATE TABLE employees;
```

Table name

- To drop a table – delete data and structure

```
DROP TABLE employees;
```

Table name

- To drop entire database

```
DROP DATABASE soft_uni;
```

Database name

Dropping and Truncating (2)

- To remove a constraining rule from a column
 - Primary keys, value constraints and unique fields

```
ALTER TABLE employess  
DROP CONSTRAINT pk_id;
```

Table name

Constraint name

- To remove **DEFAULT** value (if not specified, revert to **NULL**)

```
ALTER TABLE employess  
ALTER COLUMN clients  
DROP DEFAULT;
```

Table name

Columns name

Summary

- Table columns have a **fixed type**
- We can use GUI Clients to **create** and **customize** tables
- SQL provides **greater control**

```
CREATE TABLE people  
(  
    id INT NOT NULL,  
    email VARCHAR(50) NOT NULL,  
    first_name VARCHAR(50),  
    last_name VARCHAR(50)  
);
```
